

## How to connect sqlite database in android

Continue

Ben Stockton / How-To Geek Android devices are great, but their small size can sometimes be limiting. When you connect your device to a projector, you can share your screen with others for business or pleasure. Here are a few ways to do it. If you don't have a projector, you can also connect Android to a TV. Projectors are the better option, though, as they normally project a much bigger screen size than a TV, making them ideal for media playback or data presentations. RELATED: How to Connect Your Android Phone to Your TV Connect Wirelessly via Chromecast The easiest method to connect an Android device to a projector is to use Google Chromecast. To do this, your projector must support HDMI connections. Once you plug your Chromecast into the HDMI port, you can then wirelessly stream your Android device screen to it. Your Chromecast will then display the contents through the projector. Make sure you've disabled any power-save mode on your Android device, as this can reduce the quality of the stream. If you don't already have the Google Home app, download and install it from the Google Play Store. Open the "Home" app, and then tap the Accounts tab in the bottom-right corner. Scroll down and tap "Mirror Device." If you see a warning that your device isn't optimized for casting, tap "OK." This shouldn't prevent you from casting your screen to a Chromecast. Tap "Cast Screen/Audio," and then select your Chromecast to connect to it. Once you're connected, your screen should begin streaming to your projector through your Chromecast. Wired Connections If a wireless option isn't suitable, you can use a wired connection instead. All Android devices come with either a microUSB or USB-C option. With the right cable, you can connect your Android device to a projector that directly uses an HDMI cable. Another supported standard is MHL, which also connects via HDMI ports. USB-C to HDMI Cable Newer Android devices, like the latest Samsung phones, use USB-C to charge. If you have a USB-C device, you can use a USB-C to HDMI cable to connect your device directly to an HDMI-capable projector. Amazon You shouldn't have to do anything other than connect your USB-C device to your projector. Make sure the projector is set to the correct HDMI input. Be aware, however, that one disadvantage of USB-C to HDMI is lack of power. If you use other wired methods, like MHL, you can power your device while connected. Mobile High-Definition Link (MHL) Mobile High-Definition Link (MHL) uses specially-designed HDMI cables. Unlike the newer USB-C method, MHL cables use microUSB. As mentioned above, it can also power your device while providing digital video and audio. Amazon Some projectors support HDMI, but you'll need to look specifically for an HDMI port with an MHL label on your projector. If you don't see one, it won't power your device. Your Android device also has to support MHL. To connect via MHL, you shouldn't have to do anything on your projector with a suitable cable. On your projector, switch the input to the corresponding MHL HDMI port to see your projected Android screen. Wireless Connections Miracast and Wi-Fi Direct are wireless standards that connect devices to other devices like displays. Previously, Android officially supported Miracast but dropped it with Android 6 Marshmallow. Miracast still works with some Android devices, though, because it's based on Wi-Fi Direct, which is still supported by Android. RELATED: Wireless Display Standards Explained: AirPlay, Miracast, WiDi, Chromecast, and DLNA Unless both devices specifically state they support Wi-Fi Direct or Miracast, the best way to see if it will connect is to use one of these standards to try it. To start, on your projector, look for "Screen Mirroring," "Device Mirroring," or a similarly named setting, and then switch to that mode. The best way to connect using Miracast is to use a third-party app, like Castto, to make the connection. As it's no longer officially supported, using Miracast with modern Android devices is not guaranteed to work. If that's the case, use a Chromecast, wired connection, or attempt to use Wi-Fi Direct. Wi-Fi Direct If you want to use Wi-Fi Direct, you can do this within Android directly. These steps might vary slightly depending on your version of Android and your device. You need a projector that supports Wi-Fi Direct and allows you to stream your screen using this method. To begin, swipe down on your display to access your notification shade, and then tap the gear icon to access your Android "Settings" menu. Alternatively, you can access your "Settings" menu from the apps drawer. If you're on a Samsung device, tap "Connections." On other Android devices, you might need to tap "Network & Internet" instead. Tap "Wi-Fi" to access the Wi-Fi menu. In the Wi-Fi menu, ensure the setting is turned on, and then tap "Wi-Fi Direct." On other Android devices, you might have to tap "Advanced" or "Wi-Fi Preferences" in this menu first, and then tap "Wi-Fi Direct" to access that menu. Your device will scan automatically for available Wi-Fi Direct devices. If it locates your projector, tap the option to connect, and then follow the instructions. Smart View on Samsung Devices If you own a Samsung device, you can use Smart View to connect to some devices wirelessly. Swipe down your notifications shade and tap "Smart View" in your quick actions list. Your device will scan for nearby Chromecast or Miracast devices. Locate your device, and then tap it to connect. Your Samsung device should connect to your projector and begin streaming to it. Manufacturer Apps Some projector manufacturers offer their own Android apps that allow you to connect directly to the projector from your device via Wi-Fi. Apps like Panasonic Wireless Projector, Epson iProjection, and Projector Quick Connection are all examples of apps you could try, depending on the manufacturer of your projector. These apps might not allow you to project your entire screen, but they should allow you to project static images or document files to your projector. While this wouldn't be a useful method to stream media, it could come in handy for business presentations. If you're familiar with spreadsheets like Microsoft Excel, you already understand how data can be used with tables. Databases also use tables to store, manage, and retrieve information. You may not realize it but you encounter the power of databases all the time in your daily life. For example, when you log into your online banking account, your bank first authenticates your login using your username and password and then displays your account balance and any transactions. A database operating behind the scenes evaluates your username and password combination and provides access to your account. It then filters your transactions to display them by date or type, as you request. Databases are different from spreadsheets in that they're better at storing large amounts of data and manipulating it in various ways. Here are just a few actions you can perform with a database that would be difficult, if not impossible, to perform using a spreadsheet: Retrieve all records that match certain criteria Update records in bulk Cross-reference records in different tables Perform complex aggregate calculations A database is made up of many different tables. Like Excel tables, database tables consist of columns and rows. Each column corresponds to an attribute and each row corresponds to a single record. For example, consider a database table that contains names and telephone numbers for the 50 employees at Company X. The table is set up with columns labeled "FirstName," "LastName," and "TelephoneNumber." Each row contains the corresponding information for one individual. Because there are 50 individuals, the table has 50 entry rows and one label row. Each table in a database must have a unique name and each must have a primary key column so that each row (or record) has a unique field to identify it. The data in a database is protected by constraints, which enforce rules on the data to ensure its overall integrity. A unique constraint ensures that a primary key cannot be duplicated. A check constraint controls the type of data you can enter. For example, a Name field can accept plain text, but a Social Security Number field must include a specific set of numbers. One of the most powerful features of a database is the ability to create relationships between tables using foreign keys. For example, you might have a Customers table and an Orders table. Each customer can be linked to an order in your Orders table. The Orders table, in turn, might be linked to a Products table. This method simplifies database design so you can organize data by category, rather than trying to put all the data into one or just a few tables. A database only holds data. To make real use of that data, you need a database management system. A DBMS is the database itself, along with the software and functionality required to retrieve or insert data. A DBMS creates reports, enforces database rules and constraints, and maintains the database schema. Without a DBMS, a database is just a collection of bits and bytes with little meaning. If you'd like to try creating a database, a good place to start would be a database program like Microsoft Access. FAQ What is a database schema? A database's schema is its structure. It specifies what information, or objects, can enter the database and defines the relationship between them. Schema are typically defined using Structured Query Language (SQL). What is a relational database? A relational database stores data points that are related to each other. It organizes the data into one or more tables, each one with a unique key identifying it. What is a database query? A query is simply a request for information from a database. The data can come from one or more tables in the database, or it can come from other queries. Whenever you type in a Google search, you're sending a query, for example. What is a database record? A record is the set of data that's stored in a table. Records are also sometimes called a tuple. What is a foreign key in a database? A foreign key is a common component that links data in two tables together. The foreign key refers to the primary key of another table called the parent table. The table containing the foreign key is called the child table. What is an entity in a database? An entity is an object that exists within the database. It can be a person, place, unit, or any abstract concept you wish to store information about. For example, a school database can contain students, teachers, and courses as entities.
